

FEATURES

- Optimised bipolar output voltages for IGBT/ Mosfet, SiC & GaN gate drives
- Reinforced insulation to UL62368-1 recognised
- ANSI/AAMI ES60601-1, 1 MOPP/2 MOOPs pending
- 5.2kVDC isolation test voltage 'Hi Pot Test'
- Ultra low isolation capacitance
- 5V, 12V, 15V & 24V inputs
- +6V/-3V, +15V/-3V, +15V/-5V, +15V/-9V, +18V/-2.5V & +20V/-5V outputs
- Operation to 105°C
- Characterised CMTI >200kV/μs
- Continuous barrier withstand voltage 2.4kVDC
- Characterised partial discharge performance

PRODUCT OVERVIEW

The MGJ1 SIP series of DC-DC converters is ideal for powering 'high side' and 'low side' gate drive circuits for IGBT/Mosfet, SiC & GaN gate drives in bridge circuits. A choice of asymmetric output voltages allows optimum drive levels for best system efficiency and EMI. The MGJ1 SIP series is characterised for high isolation and dv/dt requirements commonly seen in bridge circuits used in motor drives and inverters, while the MGJ1 SIP high operating temperature rating and construction gives long service life and reliability.

MGJ1 SIP Series

5.2kVDC Isolated 1W Gate Drive DC-DC Converters

SELECTION GUIDE

TECHNICAL NOTES

ISOLATION VOLTAGE

'Hi Pot Test', 'Flash Tested', 'Withstand Voltage', 'Proof Voltage', 'Dielectric Withstand Voltage' & 'Isolation Test Voltage' are all terms that relate to the same thing, a test voltage, applied for a specified time, across a component designed to provide electrical isolation, to verify the integrity of that isolation.

Murata Power Solutions MGJ1 SIP series of DC-DC converters are all 100% production tested at 5.2kVDC for 1 second and have been qualification tested at 5.2kVDC for 1 minute.

The MGJ1 SIP series is recognised by Underwriters Laboratory, please see safety approval section for more information. When the insulation in the MGJ1 SIP series is not used as a safety barrier, i.e. provides functional isolation only, continuous or switched voltages across the barrier up to 2.4kV are sustainable. This is established by measuring the partial discharge inception voltage in accordance with IEC 60270. Please contact Murata for further information.

REPEATED HIGH-VOLTAGE ISOLATION TESTING

It is well known that repeated high-voltage isolation testing of a barrier component can actually degrade isolation capability, to a lesser or greater degree depending on materials, construction and environment. We therefore strongly advise against repeated high voltage isolation testing, but if it is absolutely required, that the voltage be reduced by 20% from specified test voltage.

SAFETY APPROVAL

ANSI/AAMI ES60601-1

The MGJ1 SIP series is pending recognition by Underwriters Laboratory (UL) to ANSI/AAMI ES60601-1 and provides 1 MOOP (Mean Of Operator Protection) based on a working voltage of 300Vrms or 2 MOOP and 1 MOPP (Mean Of Patient Protection) based on a working voltage of 200Vrms, between Primary and Secondary.

File number E202895 applies.

UL62368-1

The MGJ1 SIP series is recognised by Underwriters Laboratory (UL) to UL62368-1 for reinforced insulation to a working voltage of 300Vrms or basic insulation to a working voltage of 600Vrms.

File number E151252 applies.

Creepage and clearance 6mm

Working altitude 5000m

Fusing

The MGJ1 SIP series of converters are not internally fused so to meet the requirements of UL an anti-surge input line fuse should always be used with ratings as defined below.

MGJ1D05xxxxSC: 430mA

MGJ1D12xxxxSC: 170mA

MGJ1D15xxxxSC: 140mA

MGJ1D24xxxxSC: 90mA

All fuses should be UL recognised and rated to 125VDC.

RoHS COMPLIANCE INFORMATION

This series is compatible with RoHS soldering systems with a peak wave solder temperature of 260°C for 10 seconds. Please refer to [application notes](#) for further information. The pin termination finish on this product series is Tin Plate, Hot Dipped over Matte Tin with Nickel Preplate. The series is backward compatible with Sn/Pb soldering systems. For further information, please visit www.murata.com/en-global/products/power/rohs

ENVIRONMENTAL VALIDATION TESTING

The following tests have been conducted on this product series, as part of our design verification process. The datasheet characteristics specify user operating conditions for this series, please contact Murata if further information about the tests is required.

Test	Standard	Condition
Temperature cycling	JEDEC JESD22-A104	200 cycles in a dual zone chamber from -40 (+5/-10)°C to 105 (+10/-5)°C. 15mins dwell at each (inclusive of ramps). 2 cycles per hour.
Humidity bias	JEDEC JESD22-A101	85°C ± 2°C, 85% ± 5% R.H. for >1000 hours.
High temperature storage life	JEDEC JESD22-A103, Condition A	125°C (+10/-0°C) for ≥1000 hours.
Vibration	MIL-STD-883 Method 2007, Condition A	1.5mm pk-pk / 20g pk min, 20-2000-20Hz, 4 sweeps in each of 3 mutually perpendicular axes at 3 oct/min.
Shock	MIL-STD-883 Method 2002, Condition A	500g 1.0ms half sine, 5 shocks in each direction of 3 mutually perpendicular axis.
ESD	JEDEC JESD22-A114	HBM 8.0kV.
Bump	IEC Class 4M5 of ETS 300 019-2-4	Shock Spectrum Type II, 6ms duration, 250m/s ² 500 bumps in 6 directions.
Solderability	EIA/IPC/JEDEC J-STD-002, Test A and A1	SnPb (Test A) For leaded solderability the parts are conditioned in a steam ager for 8 hours ±15 min. at a temperature of 93°C ±3°C. Dipped in solder at 245°C ±5°C for 5 (+0/-0.5) seconds. Pb-free (Test A1) For lead free solderability the parts are conditioned in a steam ager for 8 hours ± 15 min. at a temperature of 93°C ±3°C. Dipped in solder at 255°C ±5°C for 5 (+0/-0.5) seconds.
Solder heat	JEDEC JESD22-B106	The test sample is subjected to a molten solder bath at 270°C ±5°C for 7 (+2/-0) seconds.
Solder heat (hand)	MIL-STD-202 Method 210, Condition A	The soldering iron is heated to 350°C ±10°C and applied to the terminations for a duration of 4 to 5 seconds.
Solvent cleaning	Resistance to cleaning agents	Solvent – Novec 71IPA & Topklean EL-20A. Pulsed ultrasonic immersion 45°C - 60°C.
Solvent Resistance	MIL-STD-883 Method 2015	Separate samples subjected to IPA cleaning.
Lead Integrity (Adhesion)	MIL-STD-883 Method 2025	Leads are bent through 90° until a fracture occurs.
Lead Integrity (Fatigue)	MIL-STD-883 Method 2004, Condition B ₂	The leads are bent to an angle of 15°. Each lead is subjected to 3 cycles.
Lead Integrity (Tension/Pull)	MIL-STD-883 Method 2004, Condition A ₁	Pull of 0.227kg applied for 30 seconds. The force is then increased until the pins snap.
Aqueous wash	Resistance to wash process	Parts washed in an aqueous/ultrasonic process, in a suitable chemical for 30 mins at a controlled temperature. Followed by a towns water wash at low pressure and a demineralised water wash at low pressure. Dried in a vacuum oven.

PART NUMBER STRUCTURE

CHARACTERISATION TEST METHODS

Ripple & Noise Characterisation Method

Ripple and noise measurements are performed with the following test configuration.

C1	1 μ F X7R multilayer ceramic capacitor, voltage rating to be a minimum of 3 times the output voltage of the DC-DC converter
C2	10 μ F tantalum capacitor, voltage rating to be a minimum of 1.5 times the output voltage of the DC-DC converter with an ESR of less than 100m Ω at 100kHz
C3	100nF multilayer ceramic capacitor, general purpose
R1	450 Ω resistor, carbon film, $\pm$ 1% tolerance
R2	50 Ω BNC termination
T1	3T of the coax cable through a ferrite toroid
RLOAD	Resistive load to the maximum power rating of the DC-DC converter. Connections should be made via twisted wires

Measured values are multiplied by 10 to obtain the specified values.

Differential Mode Noise Test Schematic

APPLICATION NOTES

Minimum load

The minimum load to meet datasheet specification is 10% of the full rated load across the specified input voltage range. Lower than 10% minimum loading will result in an increase in output voltage, which may rise to typically 1.5 times the specified output voltage if the output load falls to 0%.

Gate Drive Applications Advisory Note

For general guidance for product usage in gate drive applications please refer to ["gate drive application notes"](#).

MGJ1DXX0603MC Capacitive loading and start up

The typical start up for single output variants, using a 56uF capacitor is 5mS. The start up behaviour of the +Vout and -Vout rails of a dual output DC-DC using a divider network depends significantly on the additional capacitance added to the outputs. This is because the two capacitors behave as a capacitive divider. If the two capacitors are equal and 9V is applied across them the outputs will initially start as +/-4.5V.

There will be a settling time while the divider circuit adjusts to the correct voltages, to calculate the approximate value please refer to the following formula.

Settling time $\approx 3000 \times C$ (s)

So, for instance if a maximum capacitance of 100uF is applied to each output the settling time will be about 300ms.

To avoid spurious gate pulses it is recommended that the PWM gate signal is not applied until after the settling time has ended.

An alternative method to reduce the settling time is to adjust the values of the additional capacitance so that the CV products are equal. i.e. $C3 \times 6V = C4 \times 3V$.

So, for instance if a maximum capacitance of 75uF is applied to the +6V output and 150uF is applied to the -3V output the settling time is greatly reduced.

NB: The total maximum series capacitance across 9V = 50uF.

APPLICATION NOTES (Continued)

Capacitive loading and start up

Typical start up times for this series, with a typical input voltage rise time of 2.2μs and output capacitance of 10μF, are shown in the table below. The product series will start into capacitance up to 47μF with increased start times.

Typical Start-Up Wave Form

APPLICATION NOTES (Continued)

Dual Output Configuration MGJ1D050603SC and MGJ1D120603SC:

The MGJ1D050603SC and MGJ1D120603SC provide a dual output by using a reference IC and resistor divider network circuit with patented short circuit protection. This is important to maintain an accurate 6V to the gate of the GaN device over the temperature range and operating conditions, something a Zener diode cannot guarantee.

All Other Variants:

The MGJ1 SIP series is a dual output DC-DC specifically designed for gate drive applications and its output configuration is not suitable for application usage as a general dual output DC-DC converter. However the MGJ1 SIP series can be used as a general purpose single output converter, by loading from +Vout to -Vout.

The MGJ1DXX1503SC, MGJ1DXX1505SC, MGJ1DXX1509SC, MGJ1DXX1802SC and MGJ1DXX2005SC provides a dual output by using a zener voltage divider network, the negative output is obtained by using a zener diode as a voltage regulator. If a short circuit occurs, the zener diode is protected. A 2V7 zener diode is used to set the -2.5Vout, a 3V3 zener diode to set the -3Vout, a 5V1 zener diode to set the -5Vout and a 9V3 zener diode is used to set the -9Vout. A tolerance of 2% should be taken into consideration for the zener diodes. All the zener diodes are rated at 400mW.

APPLICATION NOTES (Continued)

Optional Configuration:

For optional configuration where alternative negative output voltages are required, an external zener diode network can be connected across the main 18V, 20V, 20.5V, 24V or 25V output. However this zener diode will no longer be protected from short circuits as the internal short circuit protection is bypassed.

RECOMMENDED FOOTPRINT DETAILS

DISCLAIMER

Unless otherwise stated in the datasheet, all products are designed for standard commercial and industrial applications and NOT for safety-critical and/or life-critical applications.

Particularly for safety-critical and/or life-critical applications, i.e. applications that may directly endanger or cause the loss of life, inflict bodily harm and/or loss or severe damage to equipment/property, and severely harm the environment, a prior explicit written approval from Murata is strictly required. Any use of Murata standard products for any safety-critical, life-critical or any related applications without any prior explicit written approval from Murata shall be deemed unauthorised use.

These applications include but are not limited to:

- Aircraft equipment
- Aerospace equipment
- Undersea equipment
- Power plant control equipment
- Medical equipment

Murata makes no express or implied warranty, representation, or guarantee of suitability, fitness for any particular use/purpose and/or compatibility with any application or device of the buyer, nor does Murata assume any liability whatsoever arising out of unauthorised use of any Murata product for the application of the buyer. The suitability, fitness for any particular use/purpose and/or compatibility of Murata product with any application or device of the buyer remain to be the responsibility and liability of the buyer.

Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards that anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm, and take appropriate remedial actions. Buyer will fully indemnify and hold Murata, its affiliated companies, and its representatives harmless against any damages arising out of unauthorised use of any Murata products in any safety-critical and/or life-critical applications.

Remark: Murata in this section refers to Murata Manufacturing Company and its affiliated companies worldwide including, but not limited to, Murata Power Solutions.

This product is subject to the following [operating requirements](#) and the [Life and Safety Critical Application Sales Policy](#):
